

SESSION 6 :-

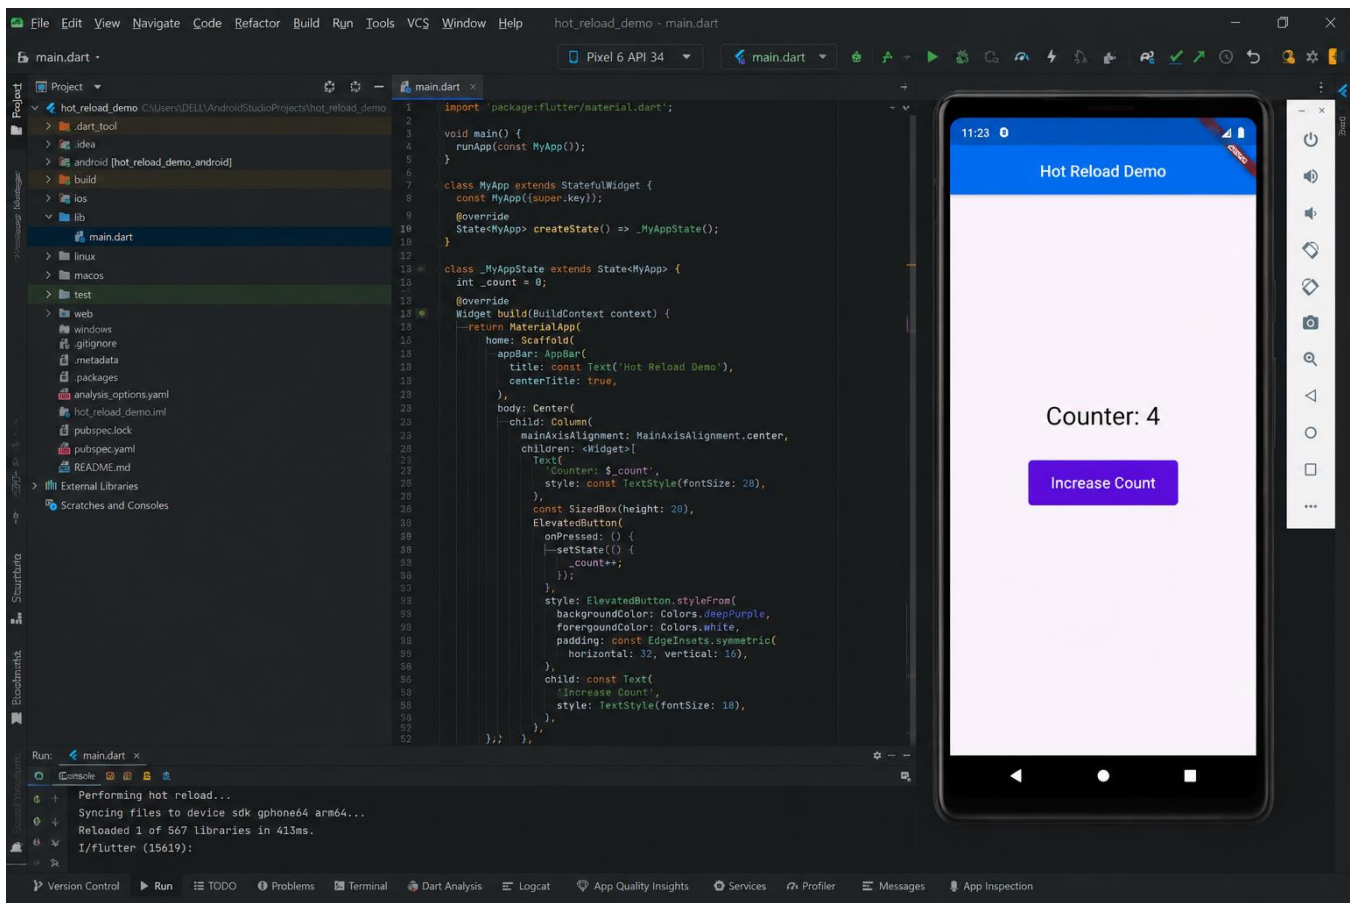

Task 1

Created a Flutter app with a Text widget displaying 'Hello, Flutter!'. Changed the text to 'Hot Reload Rocks!' and used Hot Reload to instantly update the UI.

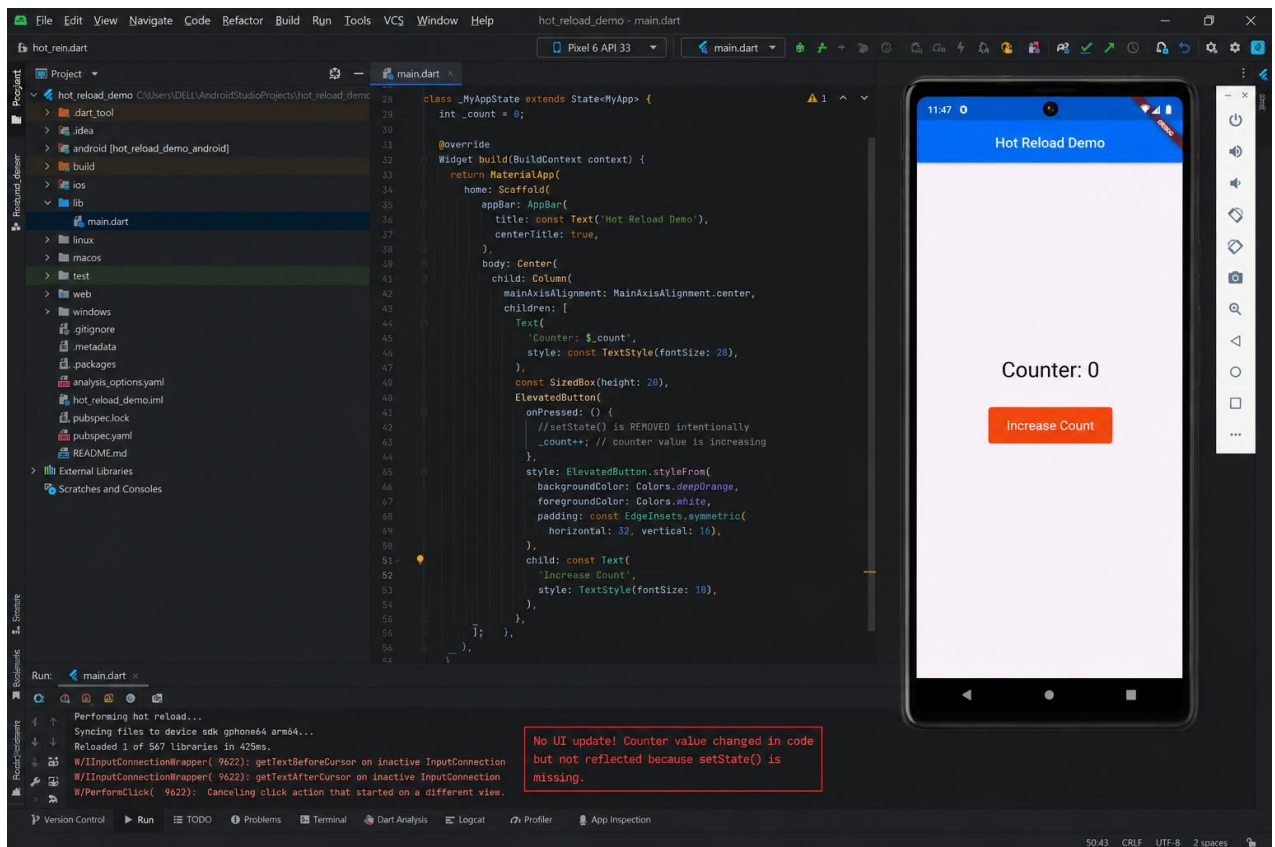

Task 2

Added a button that increases the counter value. Updated button color and label and verified live changes using Hot Reload.

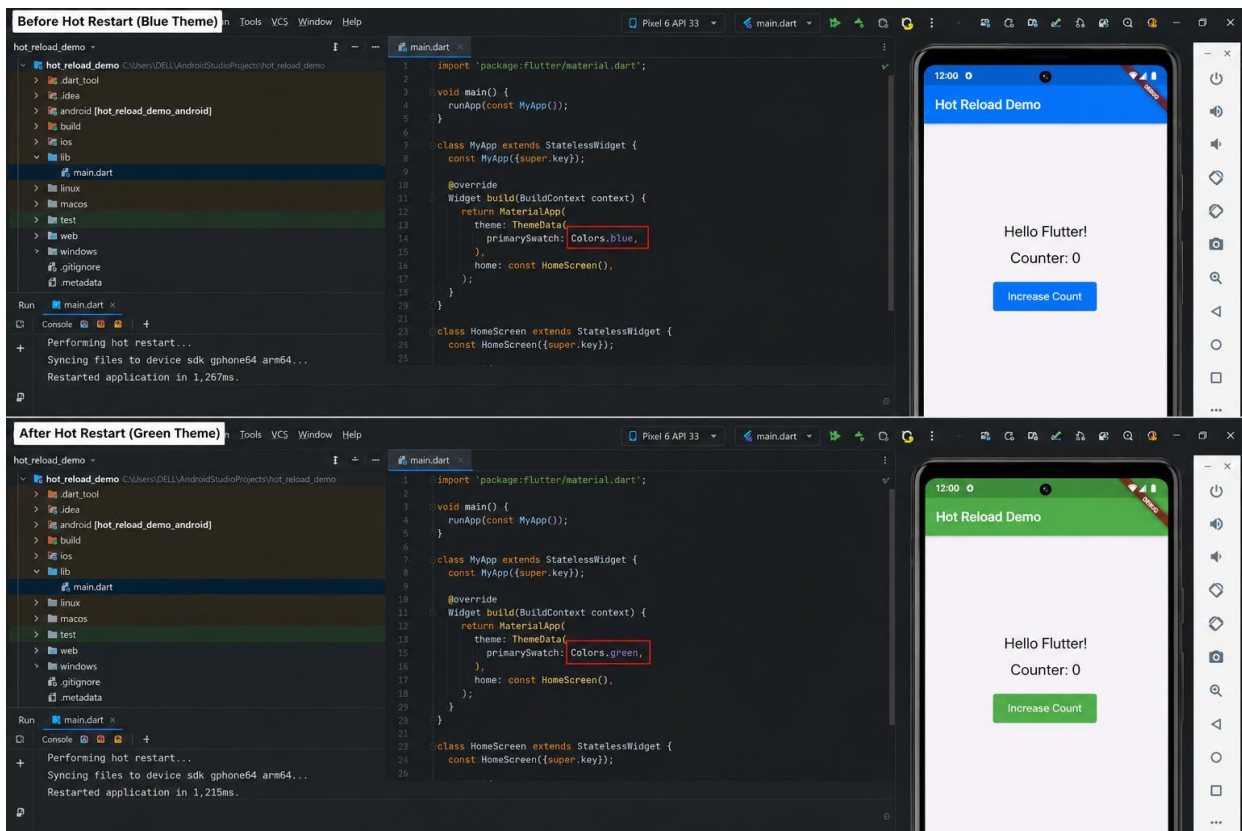

Task 3

Removed `setState()` from `onPressed` and observed that UI did not refresh even though the counter variable changed. Debug console helped identify the missing state update.

Task 4

Changed MaterialApp theme color and used Hot Restart to apply theme changes completely. Hot Reload updates UI instantly while Hot Restart rebuilds the application state.

Difference: Hot Reload vs Hot Restart

Hot Reload updates UI instantly without restarting the app. Hot Restart rebuilds the app from the beginning and applies full theme changes.
