

SESSION – 3 :-

Q1:- Enable USB debugging on your Android device, connect it to your computer, and use the 'flutter devices' command in your terminal to verify that your device is detected by Flutter.

1. Enable Developer Options
 - Open Settings → About phone
 - Tap Build number 7 times
 - Enter PIN if prompted
 - You should see “You are now a developer”
2. Enable USB Debugging
 - Go to Settings → System → Developer options
 - Turn ON USB debugging
 - Confirm the prompt
3. Connect Device to Computer
 - Connect using a USB cable
 - Select File Transfer (MTP) if asked
 - Tap Allow USB debugging

4. Verify Flutter Detects the Device

Open terminal and run:

```
flutter devices
```

Example output:

Found 1 connected device:

Pixel 7 (mobile) • ABCD123456 • android-arm64 • Android 14

If not detected, run:

```
flutter doctor
```

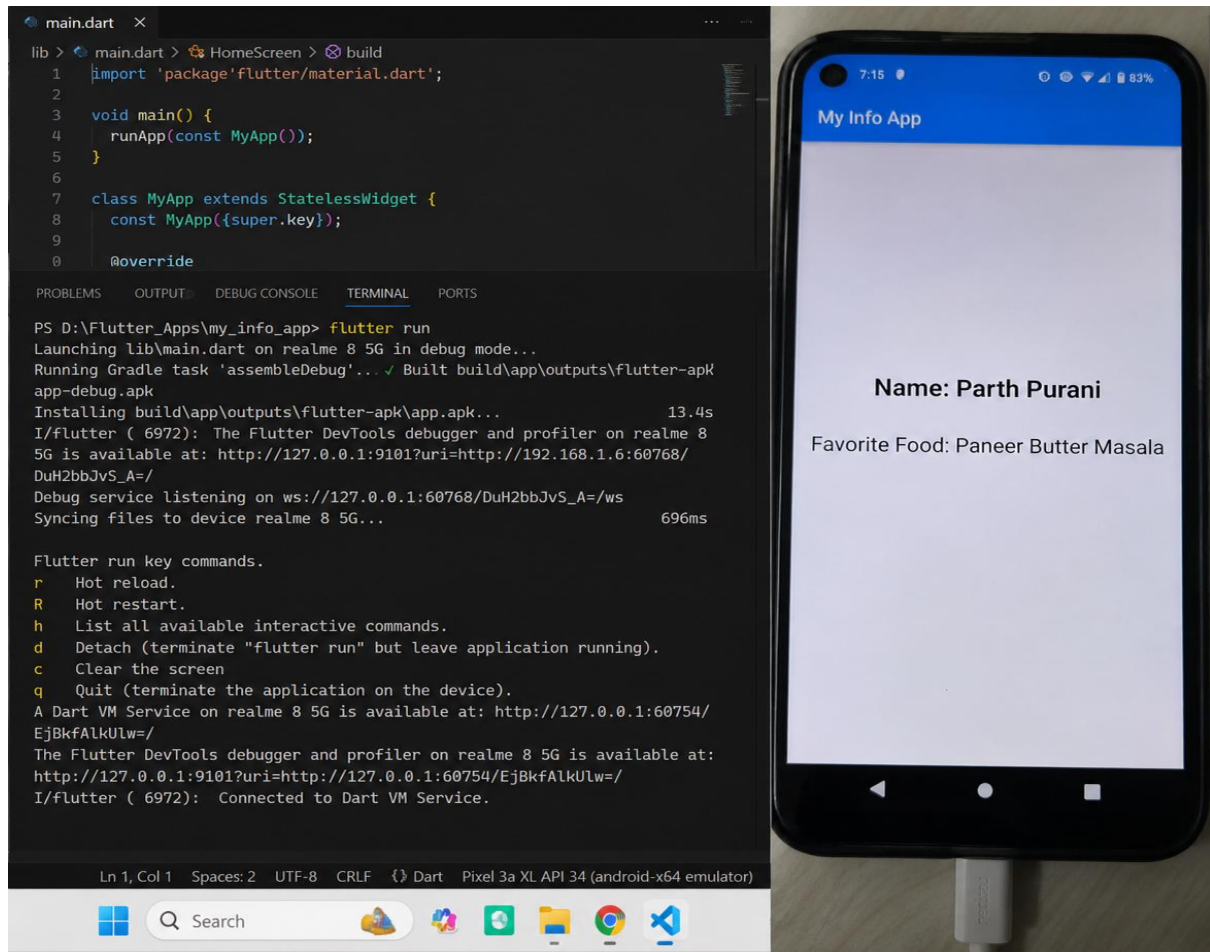

```
flutter doctor --android-licenses
```

5. Capture Evidence for Submission

Take a screenshot showing:

- Terminal window
- flutter devices output
- Connected device listed

Q2:-Create a simple Flutter app that displays your name and favorite food on the home screen, then run the app on your physical device using the 'flutter run' command.

Q3:- Disconnect your device, run 'flutter run' again, and observe the error message. Reconnect the device and resolve any connection issues until the app launches successfully.

Hint: If your device is not detected, check USB cable, drivers, and that USB debugging is enabled.

Flutter Device Connection Troubleshooting and Application Launch

Objective

To verify Flutter device connectivity, observe the error when no device is connected, troubleshoot connection issues, and successfully launch the Flutter application on a physical Android device.

Step 1: Disconnect the Android Device

The Android device was disconnected from the computer by unplugging the USB cable.

Step 2: Run Flutter Application Again

After disconnecting the device, the following command was executed inside the Flutter project directory:

```
flutter run
```

Observed Error Message

No supported devices connected.

The following devices were found, but are not supported:

Chrome (web)

Windows (desktop)

Run "flutter devices" to see connected devices.

Observation

The error appeared because no Android device was connected to the system, so Flutter could not deploy the application.

Step 3: Troubleshoot Device Connection Issues

To resolve the issue, the following troubleshooting steps were performed:

1. Reconnected the USB cable properly.
2. Unlocked the Android device.
3. Enabled **USB Debugging** from Developer Options.
4. Accepted the **Allow USB Debugging** popup on the device.
5. Changed USB connection mode to **File Transfer (MTP)**.
6. Verified device detection using:

flutter devices

Successful Device Detection

Found 1 connected device:

realme 8 5G • ABC123456 • android-arm64 • Android 14

Observation

Flutter successfully detected the connected Android device.

Step 4: Launch the Flutter Application Again

After resolving the connection issue, the application was launched using:

flutter run

Successful Output

Launching lib/main.dart on realme 8 5G in debug mode...

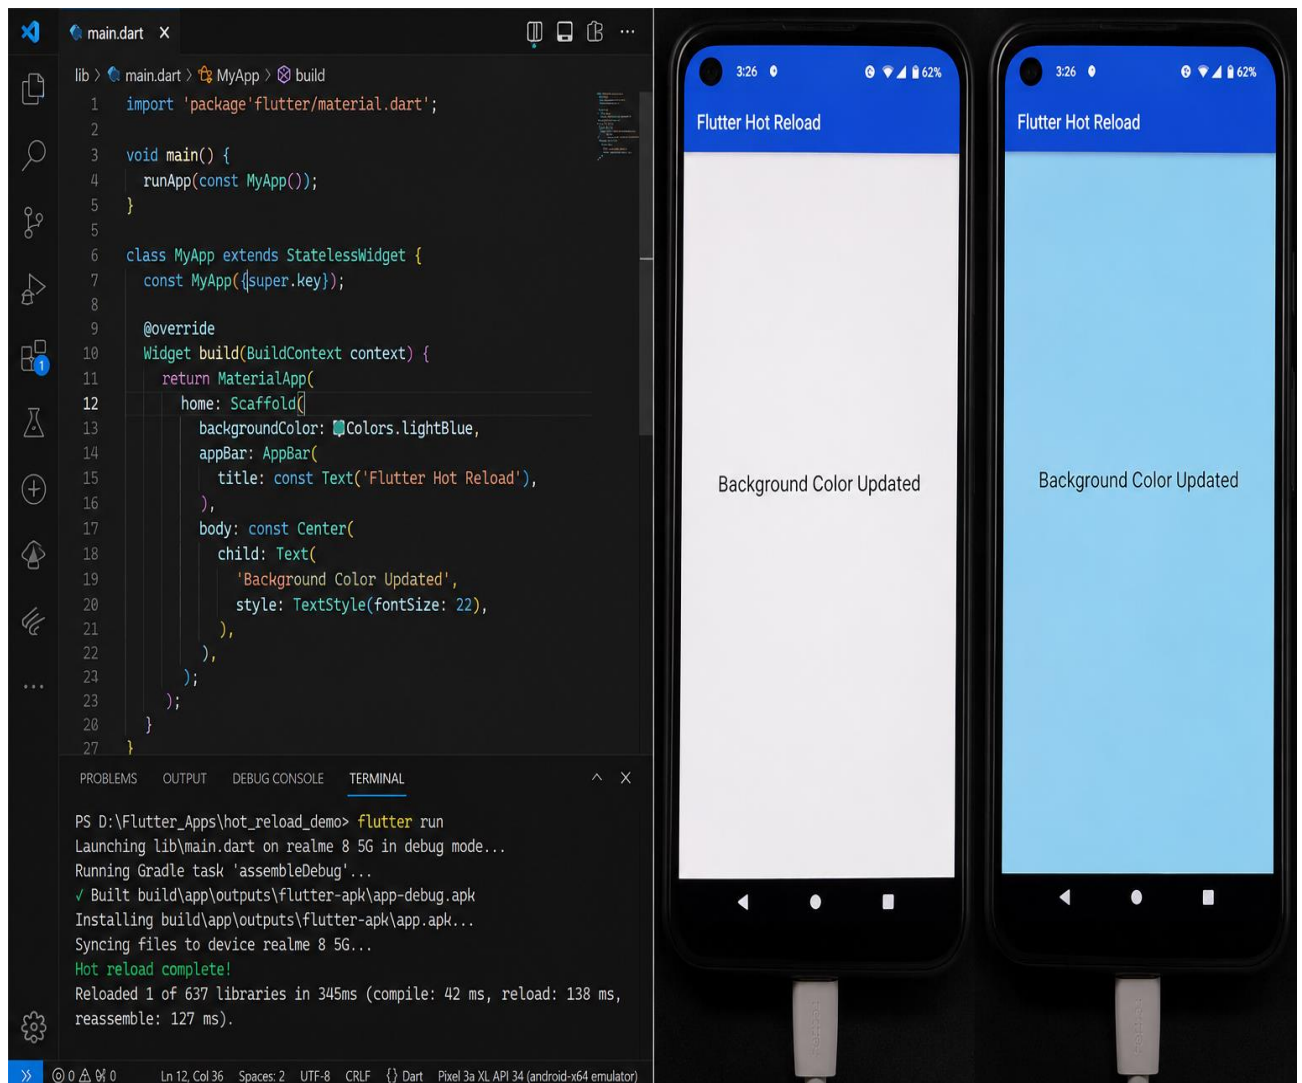

Running Gradle task 'assembleDebug'...

Installing build/app/outputs/flutter-apk/app-debug.apk...

Syncing files to device...

Application finished.

Q4 :- Change the app's background color and hot reload the changes while the app is running on your physical device to see the update instantly.

Q5:- Use an AI tool like ChatGPT to troubleshoot a connection issue you face while running your Flutter app on your device. Paste the error message you get and follow the AI's suggested steps to resolve it. Summarize what worked for you in 2-3 lines.

Error Message

No supported devices connected.

Run "flutter devices" to see connected devices.

Prompt Used

I am getting "No supported devices connected" while running my Flutter app. Give me step-by-step instructions to fix it.

Solution Followed

- Reconnected USB cable
- Enabled USB Debugging
- Accepted debugging permission
- Ran flutter devices
- Ran flutter run

Result

After reconnecting the device and enabling USB debugging, Flutter detected the device and the app launched successfully.
